

1. How to use an electric file to cut acrylic? 90 degrees
2. What is the quick tapping movement called? Tapotement
3. How to use an electric file to file acrylic nails? 30 degrees
4. What substance causes the nails to heat up during acrylic nail application? Primer
5. Electric file for shortening nails? 90 degrees
6. What should you do to complete a gel service? Apply nourishing oil to the client's hands
7. What to use if a client is allergic to one component in hand wash? Liquid disinfectant
8. What should be applied to a person with a nail-biting habit? Full nail tips
9. What should an employee do if they eat during work, then feel dizzy and tear up? Avoid eating at the work desk
10. What is the purpose of soaking nails in water? To soften the area around the cuticle
11. What is the process of disinfecting bacteria called? Sterilization
12. How to remove gel nails? Soak in acetone
13. What is the bone in the kneecap called? Patella
14. What is the process of sterilizing using UV light in a salon called? Hospital-grade disinfection
15. What part of the nail lies on the nail bed? Nail body
16. What does the MSDS (Material Safety Data Sheet) mention? Dangerous ingredients
17. The part of the nail that grows out from the tip is called? Free edge
18. What is the act of cleaning a dry, non-absorbent surface called? Disinfection
19. What is the long bone in the leg called? Shin Bone or Tibia
20. What is a wart also known as? Verruca
21. What is the angle to file the corners of nails? 60 degrees
22. What is the most important hygienic action to prevent germ transmission between people? Washing hands with soap and water
23. What is used to file metal tips for paper files? Nail tip file
24. Which organ helps the body fight toxins? Liver
25. All nail tools must be disinfected before? Used on another client
26. After a painting service, how should the technician clean up? Disinfect the entire table
27. What to recommend to a client who is allergic to liquid in acrylic nails? UV gel
28. Which organ protects the body from germs? Skin
29. If a client complains that their nails are hot and moist under the UV light, what might be the cause?
Incorrect usage of the UV light
30. What is the condition called when the nail detaches from the nail bed? Onycholysis
31. What is the part of the nail that grows out from the tip? Nail free edge
32. What is the large bone in the ankle also called? Talus
33. How do bacteria move? With flagella
34. Which type of monomer does the FDA prohibit? Methyl methacrylate
35. Which muscle separates the fingers? Abductor muscle

36. What is a contagious disease called? One that spreads from person to person
37. What should be done first to start a pedicure service? Put on gloves and ask the client to wash their hands
38. To reduce the feeling of heat when the client is under the UV light, what should the technician do?
Reduce the time under the light
39. How does applying tips differ from using acrylic gel? UV light
40. What happens when a nail gets stuck in a door and bruises? Nail disorder
41. Which muscle extends the fingers and spaces them apart? Abductor muscle
42. What should be done with towels used for a client? Change them for a new one
43. After a service, if a client wants to know what type of nail polish to use at home, how should the technician advise them? Recommend a type that suits their nails
44. What file tip is used to file acrylic nails? Nickel
45. After finishing the nail service, what should be done with the table? Disinfect and change towels
46. What is the chemical reaction that occurs when a monomer combines with a polymer? A chemical reaction
47. What is the process called when bacteria enter the body and live off of blood cells or living tissue?
Infection
48. What should be done to help the polish last longer?
49. What is another name for Hypertrophy? Onychauxis
50. What is the cause of a client's complaint about heat? Incorrect usage
51. When a client has a broken acrylic nail, where should the gel be thicker? From the nail base to the tip
52. What is Sodium hypochlorite? Floor cleaner or BLEACH
53. What organ protects the body from toxins? Skin
54. What is the term for eliminating all bacteria? Sterilization
55. What part of the nail extends into the tip? Hyponychium
56. What should be recommended to a client who doesn't want fake nails but still wants a nail service?
Builder gel
57. What tool is used to cut cuticles in the lunula area? Cuticle nippers
58. What should be done with chemical containers after they are empty? Rinse, Dry and Dispose of them
59. How should fake nails be attached during acrylic nail application? Securely under the tip of the natural nail
60. How should a metal cuticle tool be used? Horizontally, gently pressing on the nail bed
61. What type of gel binds the polymer and monomer? Builder gel
62. Which substance can be treated with LED light? Gel
63. How to check nail strength? By applying pressure at the tip
64. What is Sodium hypochlorite commonly known as? Household bleach
65. What should be used to treat split nails? Cuticle oil
66. What happens if acrylic nails are not balanced properly? They appear unnatural and uneven

67. How to quickly remove acrylic nails? Soak in acetone
68. What percentage of bacteria are harmless? around 99% of bacteria are harmless
69. What is the body's ability to fight disease called? Immunity
70. What is the chemical smell in the working room called? Fumes
71. If a technician accidentally cuts a client's hand, what should they do? Stop working
72. What type of polish remover is used for tips and acrylic nails? Non-acetone
73. What is used to shape the free edge of acrylic nails? Metal file
74. What should the technician do after finishing a service? Schedule the client's next appointment
75. What nerve extends to the little finger? Ulnar nerve
76. What is the term for the massage technique of stroking gently? Effleurage
77. What is the most important safety measure when performing acrylic nail services? Protective gear
78. What type of gel is used to create curved and shaped nails? Builder gel
79. If a client has a broken acrylic nail with redness and pain, what should the technician do? Stop the service, leave it alone, and avoid touching the nail
80. What is strong massage on the surface of the arm called? Deep tissue massage
81. How should the toenail shape be styled? Straight with slightly rounded corners
82. The success of a nail technician does not depend on? Nail disease treatment ability
83. What is the name of the finger massage technique? Shiatsu or Effleurage
84. Sea sand, glass beads, and fragrance are found in which product? Exfoliants
85. The largest long bone in the upper arm is? Humerus
86. The nerve that runs from the center to the tips of the fingers is called? Digital nerve
87. When should you ask a client about allergies in the salon? at Consultation
88. Which monomer has the lightest fragrance? Ethyl acrylic
89. After the final drying step in a gel service, what should be done to remove the remaining sticky substance? wipe with cotton ball soaked in 99% isopropyl alcohol.
90. A client who has acrylic nails complains that the nails cracked in the middle. What might be the cause?
Incorrect polymer ratio,
91. The largest bone in the knee area is? -Patella
92. What nail tip shape should be used for a round nail? Oval-shaped
93. When applying a nail tip, where should it be attached? At the tip's edge and the stopping point at the nail tip
94. What should be used to remove cream from its container? A clean spatula
95. When nail polish is left in an open bottle, causing it to evaporate and dry, what is this phenomenon? A physical phenomenon
96. Which type of light can be used for treatment? Light therapy
97. A client with acrylic nails complains that the product has peeled off from the skin. What is likely the issue? The product overflowed onto the skin
98. The layer of skin deep within the nail root is called? Nail Matrix

99. If a client wants to remove gel nails but does not have the proper tool, what should they do? Soak a cotton ball with acetone and wrap it in aluminum foil
100. A liquid kept in a cold room (room temperature) and freezes, what is this now? A solid
101. If a technician accidentally spills monomer on their feet, how could they be excessively exposed? Absorption
102. What should be done to prevent the spread of diseases? Sanitation
103. If a client has egg-shell nails, what should the technician do? Use the fine side of the nail file
104. Which nail shape is the weakest? Stiletto Nail Shape
105. The final step after performing a gel manicure is to remove the sticky residue by? wipe with alcohol
106. Where can you learn the safety instructions for a product? MSDS
107. Under what condition is the MSDS effective for each product? -When MSDS is current and readily accessible.
108. What is the bone of the hand called? Metacarpals
109. Which bone is located beside the big toe? Sesamoid Bones
110. Which bone runs along the little finger? Ulna
111. The tibia is also called? The shin bone
112. When should toenails be filed? When the nails are dry
113. If a client complains about heat during a gel manicure, what is the likely cause? The lamp was on too long
114. Which disease is caused by fungus? Ringworm (Tinea corporis)
115. When massaging the client's hand, the technique used is called? -Tapotement
116. The shinbone is also known as? The tibia
117. When should a client remove acrylic nails? -Every 2-3 weeks and maximum of 4 weeks
118. The muscle running parallel to the forearm is called? Extensor muscle
119. What should be used to clean the tip of the nails? A cotton-tipped wooden stick
120. The French tip nail shape is suitable for people with? Short round nails
121. A chemical solution used to prevent the growth of germs is called? Disinfectants for surfaces and Antiseptics for living tissue
122. If a client comes to the salon with a bandaged finger but still wants a service, what should the technician do? Assess the condition of the injured finger
123. Adding powder to fill in new growth nails is called? Fill
124. Can you serve a client with moldy and fungal nails? Remove the artificial nails first
125. When bacteria invade living organisms (70%) without causing illness, they are referred to as? Symbiotic organisms
126. What should be used to clean the nail tips? A cotton-tipped stick
127. Why does the nail become rough after using an electric file? Incorrect filing technique

128. Which type of gel prevents color fading and keeps the nail tips intact without using a UV lamp?
Gel polish
129. What causes permanent skin damage that is most visible? Polymer
130. What movement is combined with a gliding motion during a foot massage? Effleurage
131. When applying acrylic powder, what is created at the brush tip? A rounded bead of product
forms at the brush tip
132. What substance removes nail polish stains? Nail polish remover
133. When using an electric nail file, what is most important for the technician's safety? Using
personal protective equipment
134. The final step when drying gel nails, after removing the sticky residue is? Apply oil to the skin
135. After completing the service, what should be done? Disinfect the tools
136. To remove yellow stains from nails, what should be used? A nail whitening product
137. The phalanx bones are found in? Fingers
138. SDS (MSDS) lists which toxic substances required by? OSHA
139. What is the purpose of soaking feet in a foot basin? To soften the skin
140. What part of the nail protects against bacterial infection? The nail bed
141. Which tools should be cleaned and dried before being placed in a UV sterilizing cabinet? Tools
disinfected to hospital standards
142. If a client is allergic to acrylic liquid, what service should be recommended? UV Gel
143. What is the primer for acrylic nails? Acid methacrylic (primer)
144. The gliding technique combined with tapping is called? -Effleurage
145. Rapid tapping combined with tapping is called? Tapotement
146. The muscle that rotates the palm inward is called? Pronator muscle
147. The muscle that separates the fingers is called? Abductor muscle
148. What is kneading massage? Petrissage
149. What substances help moisturize the skin? Sweat and sebum (oil)
150. What term refers to efforts to prevent growth? Immunity
151. How does a disinfectant change? According to the manufacturer's instructions
152. If a client has bitten nails and wants to apply acrylic nails, where should the technician apply
them? At the point of attachment
153. What is a wart called? A verruca
154. A client with long, naturally curved nails wants which type of gel? UV Gel
155. What gel should be applied to a flat, smooth nail? Builder gel
156. What substance hardens on the spot? Adhesive
157. What is the liquid in acrylic nails? Monomer
158. If a client wants their acrylic nails removed quickly, what should be done? Continue soaking in
acetone
159. Ringworm is also known as? Fungal infection (Tinea)

160. Monomer without smell that creates a sticky layer when dry is called? A curing layer
161. The organisms that cause infections in living beings are called? Infectious organisms
162. What is the hot oil treatment used for? To soften the cuticles
163. How often should a foot basin and tools be disinfected? After every client
164. What is important when using an electric file for acrylic nails? Wear a mask to protect from dust
165. Which type of artificial nails is easiest to remove? Full-cover nails
166. What is the study of tissues called? Histology
167. For clients with ridged nails and dry skin, what should the technician do? Use oil treatments for the nails
168. What is the main ingredient in nail polish? Nitrocellulose
169. What is the main ingredient in gel? Oligomer
170. What skin layer consists of dead cells? Epidermis
171. What is the main ingredient in primer? Methacrylic Acid
172. A client with naturally beautiful and curved nails should be encouraged to use which product?
Gel polish
173. What is the main ingredient in adhesive? Cyanoacrylate
174. When trimming toenails, how should they be cut? Straight across
175. How should a foot bath be disinfected? Rinse off the dirty water
176. To ensure better adhesion of the product to the nail, what should be done? Keep the nails clean and dry
177. Skin that has been rubbed a lot may form? Blisters
178. What type of substance is acetone? A solvent
179. What is the benefit of massaging the skin? Relaxation
180. The supporting layer under the nail plate is called? The nail bed
181. How should toenails be trimmed? Straight across
182. How should toenails be filed? -Straight
183. Where should a technician get the SDS? From the manufacturer
184. Where should the technician keep the SDS? In the workplace
185. What is the largest bone in the foot? Calcaneus is the largest bone in the foot. Femur is the largest bone in the leg.
186. To avoid creating a "fire ring" with an electric file, how should it be used? Keep the file flat
187. How long does it take to complete a full nail technician course? 6 months
188. What is rapid tapping called? Tapotement
189. What is a chemical reaction that accelerates? A catalyst
190. What dissolves another substance? Solvent
191. When monomer and polymer bond, it is called? Cross-linking
192. What is the benefit of cross-linking? Strength
193. How to smooth the skin? Exfoliate

194. If a toenail is rough, what should be used? A file
195. What is the purpose of soaking feet in water? To soften the skin
196. What angle should an electric file be held when working next to the nail? At a 45-degree angle to the nail surface
197. If a client's nail tip is cracked in the middle, what is likely the issue? Too much adhesive used
198. If a client has a broken, swollen, and red nail, what should the technician do? Avoid touching that nail
199. If gel is still sticky after curing, what should the technician do? Wipe with alcohol
200. What material is the sharpest on an electric file? Carbide (carbide bit)
201. When using an electric file on calluses, what should be done? The skin must be dry
202. After finishing a service, what is not correct? Disinfect the client's hands
203. Which organization prohibits the use of harmful chemicals? FDA
204. When applying acrylic nails, where should the nail tip be placed? The arch of the nail

- 1 Polish remover used in salons for customers who wear nail tip or acrylic is – Non-Acetone
- 2 Cleanse and sanitize a customer's nails before applying artificial nails because – To Prevent Fungus
3. The ingredient in Top Coat is – Polyester Resin
4. Infection which is inflamed with pus formation affecting the tissue at the nail base may be red and swollen. Which is caused by improperly sanitized manicuring implements is called – Onychia
5. A pH scale of 7 indicates a neutral solution such as pure water. What does the pH scale tell you? - Acidity or Alkalinity
6. Your hands need to be washed with liquid soap, scrub your hands and lather for at least – 20 seconds
7. In manicuring, softening the cuticle with cuticle oil is good treatment for: Hangnails
8. One of the major elements required for good health is: A well-balanced Diet
9. What kind of brush works best for gel nails as blending and shaping: Small Flat synthetic Brush
10. In the normal adult, the average rate of nail growth is about: 1/10 inch per month
11. It will be helpful to a student's success to develop a: Pleasing Personality
12. What is the first step of decontamination: Clean , Sanitation
13. What is the nail condition that may receive a manicure: Onychophagy
14. What is the function of nerve tissue? Coordinate
15. The only true living part of the nail is the : Nail Root
16. Bacilli are bacteria with a : Rod Shaped
17. A Boil is an example of: A local Infection
18. An example of a general infection : Blood Poisoning
19. Sterilization is the process of: Killing both harmful and beneficial bacteria
20. A quaternary ammonium compounds 1,000 part per million (ppm) is commonly used as a disinfectant solution is also called : Wet Sanitizer
21. Sharp metallic instruments may be sanitized with: 70% Methyl Alcohol
22. Which of the following has the same germ-killing properties as a germicide? Disinfectant
23. The skin under the nail's free edge is hyponychium and the skin that surrounds the nail area is called: Perionychium
24. Which of the following is located beneath the free edge: Hyponychium
25. A non-pathogenic form of bacteria is called? Saprophytes
26. An inflammatory condition of the tissues surrounding the nail is known as: Onychomycosis

27. In case of a small cut, one of the following may be used: 3% hydrogen peroxide
28. Textbooks recommend that steel push should be used: Flat, with gentle pressure, on a moist nail bed
29. If "Quats" are used to disinfect implements, it must possess which of the following properties to be in compliance with the law? Bactericide, Virucide, Fungicide, All of the above.
30. The skin in which the nail body rests is known as the: Nail-Bed
31. Manicure implements will be disinfected when immersed in 70% ethyl alcohol for a period of: 10 minutes
32. The deep fold of the skin where the nail root is lodged is known as: Nail Mantle
33. The movement of the hand is controlled by: Supinator's, flexors, extensors, All of the Above
34. Adult nails grow at an average rate of 1/8 to 1/10 inch per month
35. When buffing the nail, you should stroke from : back to front of the nail
36. Another name for cuticle is: scarf skin
37. How far stripping tape should be cut from the cuticle and free edge when design: 1/16 inch
38. The muscle that closes the fingers is called: adductors
39. The nail walls are small folds of skin overlapping the sides of the nail: Body
40. The. Nail root is lodged in the nail mantle at the: Base of the nail
41. Which of the following is not the nail part of the fingernail: Mantle
42. Which of the following is not a nail disease: Onychophagy
43. The nail root begins from an actively growing tissue called the: Matrix
44. The common name for onychocryptosis is: Ingrown Nails
45. The foot massage begins with: Joint relaxer Movement
46. Finish acrylic nails are: Polymers
47. Nonpathogenic bacteria belong to the group of bacteria known as: Saprophytes
48. The joints in the ankle and wrist are known as: gliding Joints
49. Onychia is the technical term for a nail's: Overgrowth
50. Which of the following is the MSDS items: Control and protection measures, Permissible exposure limits, Primary routes of entry into the body, All of the above
51. The portion of the skin under the free edge is called: Hyponychium
52. What is the technical term for split or brittle nail? Onychorrhexis
53. What is leuconychia? White spot in the nail body
54. What product contains nitrocellulose? Enamel
55. The long and slender bones that form the palm of the hand are: Metacarpals
56. The long and slender bones that form the foot are: Metatarsals
57. To add shine to the nail, use a chamois buffer with pumice powder or: Dry Polish
58. The main part of the nail is attached to the skin at the tip of the finger which is called: Nail Body
59. The outermost layer of the skin is called the cuticle, scarf skin, and: Epidermis
60. Liquid acrylic is a type of: Monomer
